those of the Commission

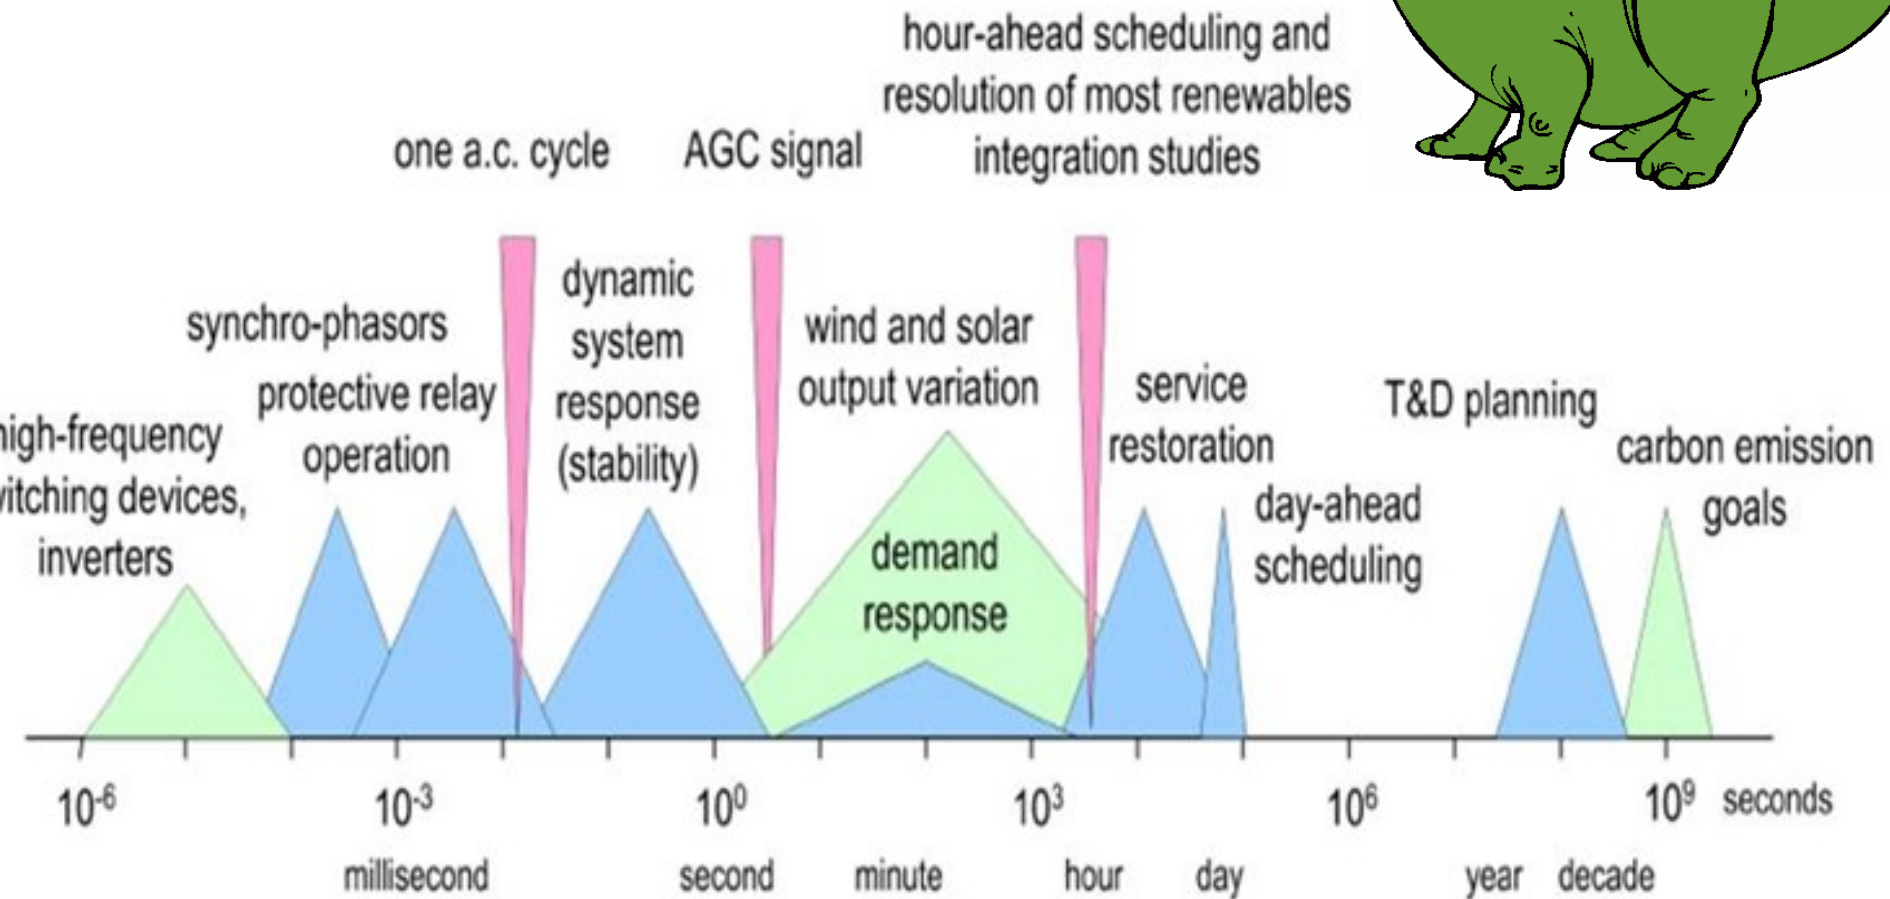

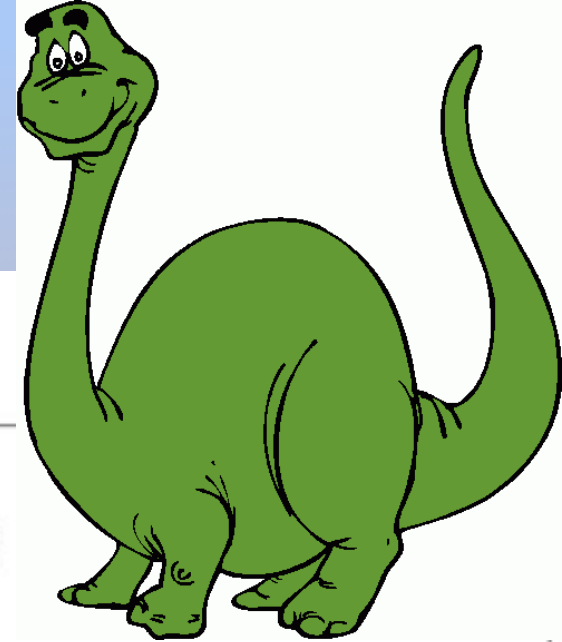

The Potential Impact...

- ⇒ United States Gross Production (2009): $\approx 4,000$ TWh
- ⇒ At \$50/MWh: cost \$600 billion/year (world)
 - ⇒ cost \$200B (billion) /year (US)
- ⇒ At \$100/MWh: cost \$2,000 billion/year (world)
 - ⇒ cost \$400B/year (US)
- ⇒ In US 10% savings is about than \$20 to \$40B/yr
- ⇒ All current ISO markets are constrained by software :-)

New markets new technologies

- ⇒ Batteries, flexible generators, topology optimization and price responsive demand
- ⇒ Need flexibility
- ⇒ optimally integrated
- ⇒ off-peak
 - ⇒ Generally wind is strongest
 - ⇒ Prices as low as $-\$30/\text{MWh}$
- ⇒ Ideal for battery charging

what we do well and what we are working on

⇒ What we do well

- ⇒ Solve sparse linear equations
- ⇒ Solve linear optimization problems
- ⇒ Solve convex optimization problems

⇒ What is more difficult

- ⇒ Problems with binary variables
 - ⇒ Startup, min run time,
 - ⇒ Optimality gap
- ⇒ Problems with continuous non-convex functions
 - ⇒ Local optima
 - ⇒ Duality gap

binding constraints on market efficiency

⇒ As

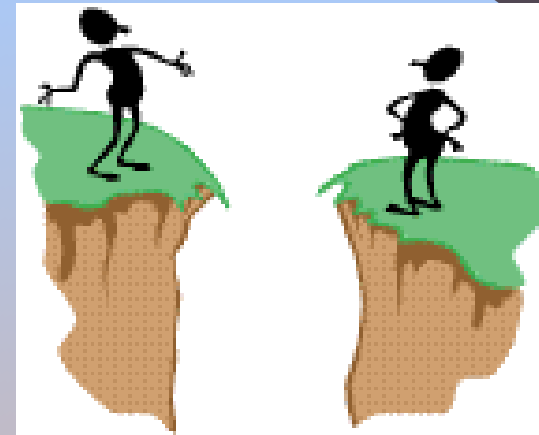

- ⇒ computers gets faster and cheaper
- ⇒ software gets faster and better
- ⇒ measurements get better, eg, PMUs
- ⇒ information transfer gets faster

⇒ There is the potential significant market efficiency improvement

⇒ binding constraints on market efficiency

⇒ Software

⇒ "Good Utility Practice"

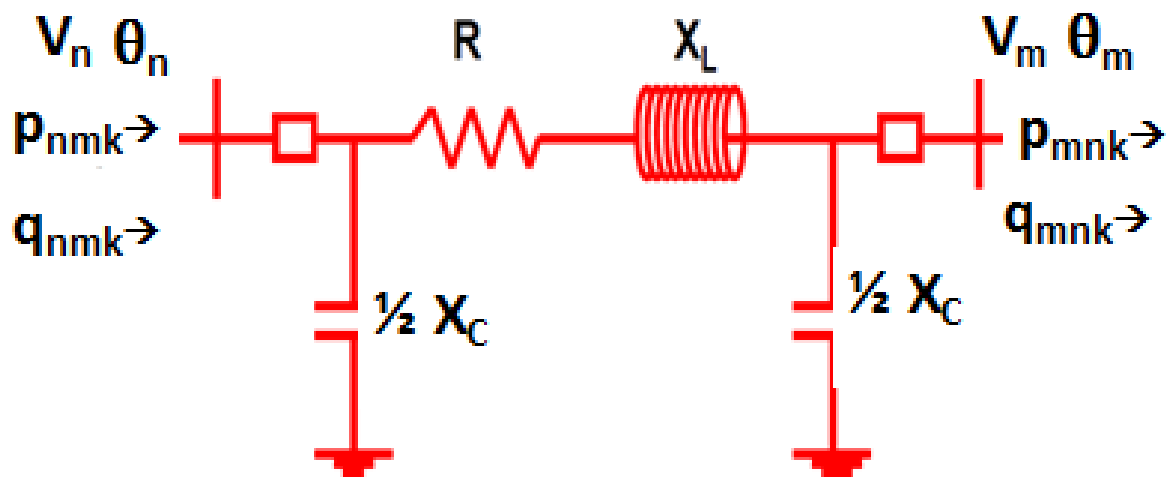

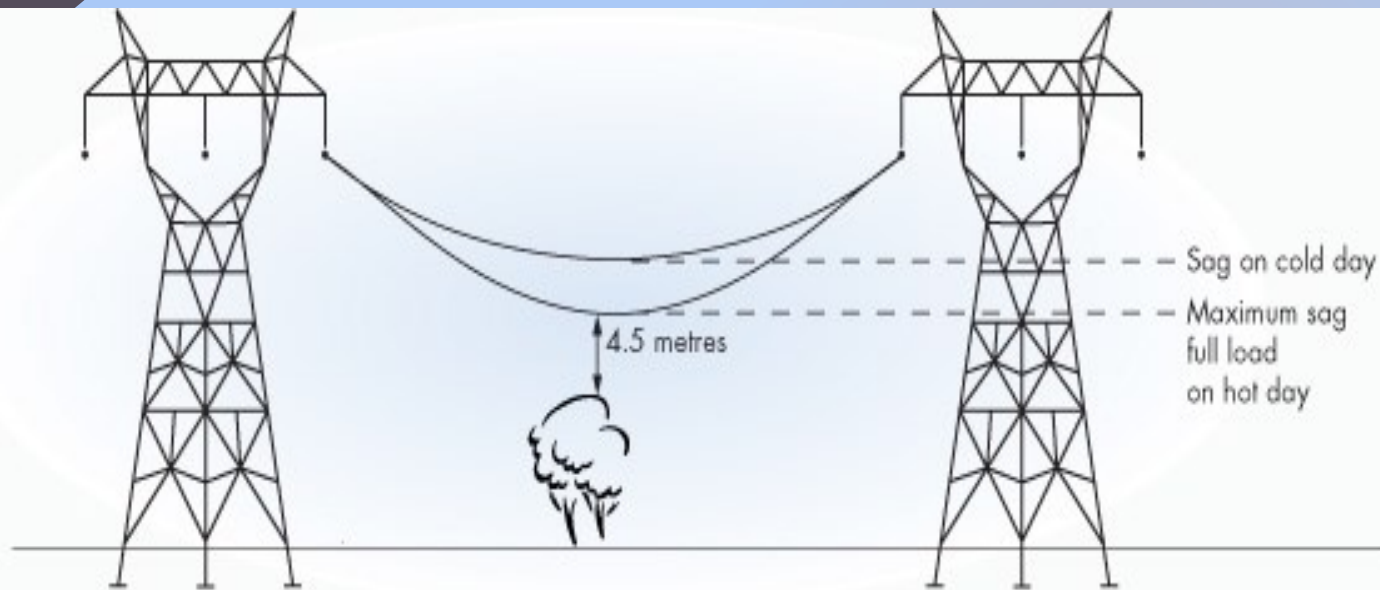

myths, shibboleths and good utility practice

- ⇒ Introduction of new technology is not the internet model
- ⇒ Entry must run the gantlet of
 - ⇒ Educational inertia: Sr. management is 30 years out of school
 - ⇒ Bureaucracy
 - ⇒ Large-scale testing on real data
 - ⇒ Reliability myths and shibboleth

Alternating Current Optima Power Flow (ACOPF)

Power Flow Equations

Polar Power-Voltage: $2N$ nonlinear equality constraints

$$P_n = \sum_{mk} V_n V_m (G_{nmk} \cos \theta_{nm} + B_{nmk} \sin \theta_{nm})$$

$$Q_n = \sum_{mk} V_n V_m (G_{nmk} \sin \theta_{nm} - B_{nmk} \cos \theta_{nm})$$

Rectangular Power-Voltage: $2N$ quadratic equality constraints

$$S = P + jQ = \text{diag}(V)I^* = \text{diag}(V)[YV]^* = \text{diag}(V)Y^*V^*$$

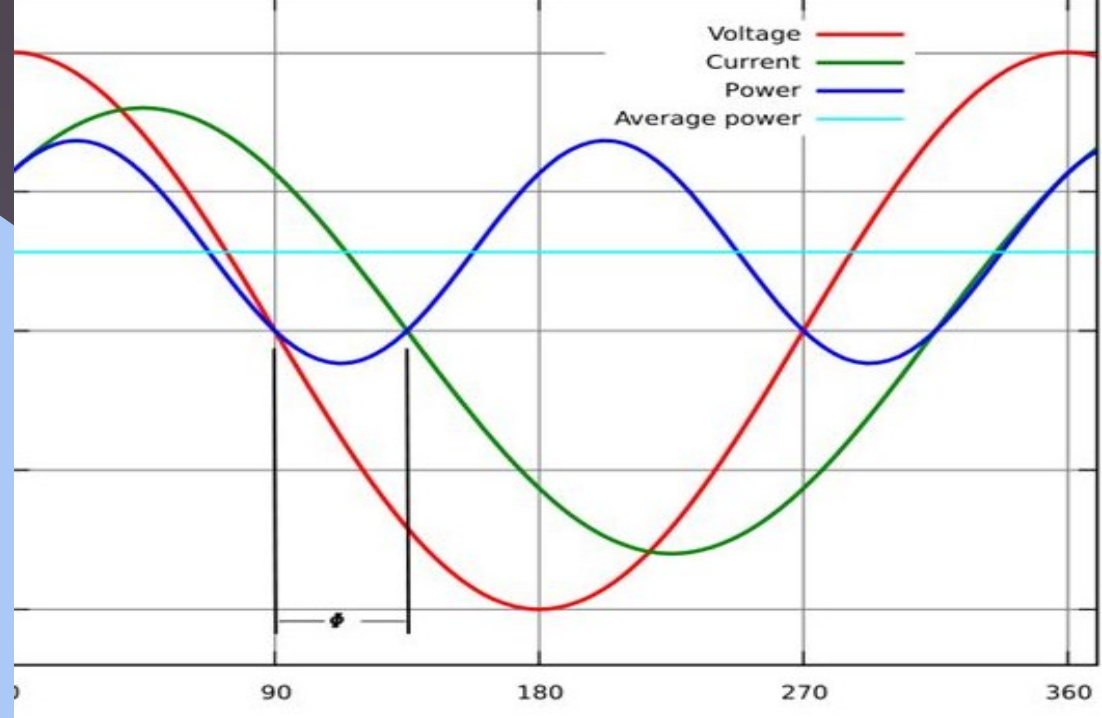

Rectangular Current-Voltage (IV) formulation.

Network-wide **LINEAR** constraints: $2N$ linear equality constraints

$$I = YV = (G + jB)(V^r + jV^j) = GV^r - BV^j + j(BV^r + GV^j)$$

$$\text{where } I^r = GV^r - BV^j \text{ and } I^j = BV^r + GV^j$$

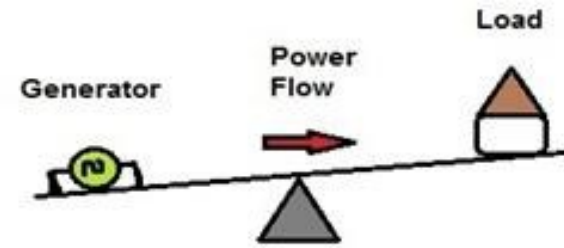

ACOPF

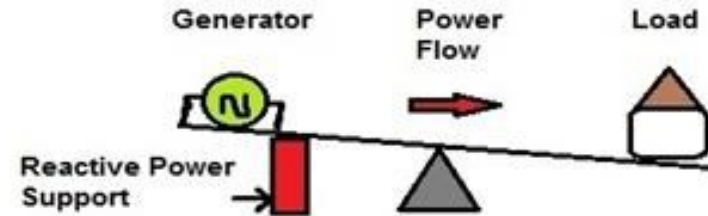

- ⇒ Includes reactive power, voltage constraints
- ⇒ Standard nonlinear solvers are faster
- Optimization is formulation dependent
 - ⇒ IV approximation is linear in the network equation
 - ⇒ Rectangular formulations solve faster
- ⇒ Convex and linear approximations
- ⇒ ARPA-E initiative to perform better testing

reactive power is it too cheap to meter?

Real power flow without
reactive power support

Real power flow WITH
reactive power support

- ⇒ In load pockets, either operator dispatch or cut set constraints are needed
- ⇒ Causes generators to start up and sit at minimum operating level to produce reactive power
- ⇒ Cost of reactive power is the startup, no-load, minimum operating level, and min runtime costs
- ⇒ Also suppresses the LMP
- ⇒ Is it too cheap to meter?

Day-ahead and Real-time Market Process

- ⇒ Primary objective: market efficiency
- ⇒ Secondary objective: good incentives and signals

Iterative decomposition and recomposition

1. Solve the DF unit commitment
2. Check for AC reliability
3. If not, modify DF and go to 1

improving the linear approximation

- ⇒ Better losses approximation
- ⇒ Introduce reactive power linearization
 - ⇒ RMR choices are weak
 - ⇒ Cut sets are a very rough approximation
 - ⇒ Introduce D-curve and transmission reactive approximation
 - ⇒ Topology improvement
 - ⇒ Corrective switching

ACOPF using semi-definitive programs

- ⇒ Javad Lavaei et al
- ⇒ received the INFORMS Optimization Society Prize
- ⇒ Convex approximation
- ⇒ Global optimal solutions For
 - ⇒ standard test problems
 - ⇒ Networks with enough PSTs
 - ⇒ Acyclic networks with positive LMPs
 - ⇒ Penalized reactive power on 'problematic' lines
- ⇒ Algorithms are getting faster

Optimal Topology

problem	current	next decade
Corrective switching	little	Real-time
Topology estimator		
Real-time market	Pre-studied	Real-time
day-ahead market	Pre-studied	Day ahead
Maintenance scheduling	none	monthly
Optimal planning	none	annual

optimal transmission switching

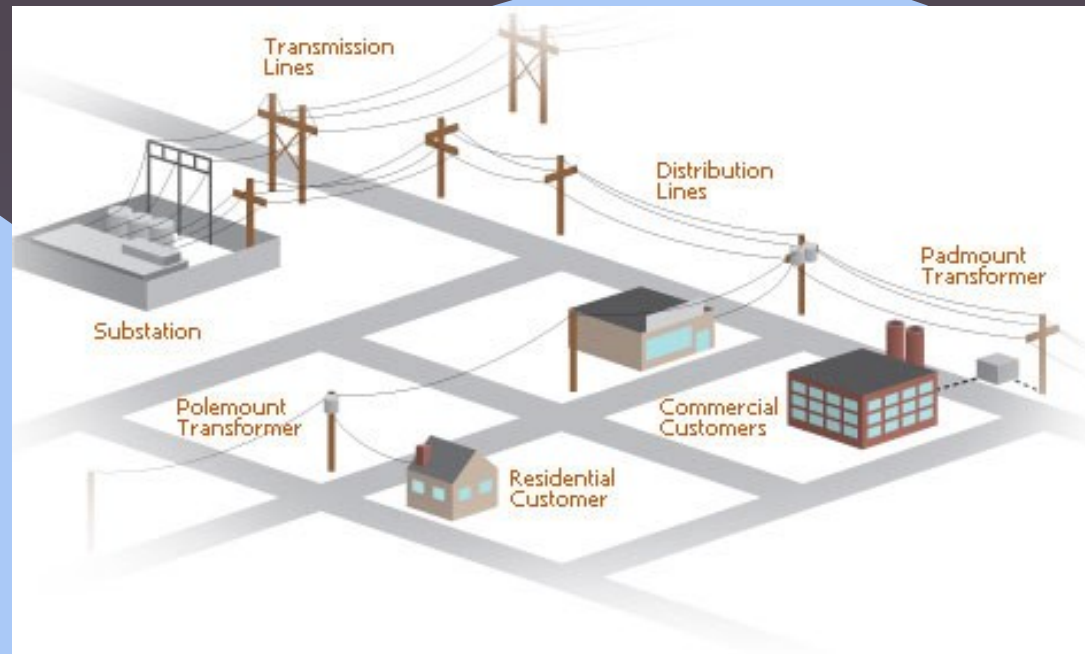

- ⇒ 2008 Fisher et al 118 bus model 25% savings found.
- ⇒ Hedman et al ISONE model 13% savings
- ⇒ 2009 Hedman et al N-1 reliability constraints 8% savings
- ⇒ 2015 Ruiz et al limited to 6 opens and 6 closes per hour
 - ⇒ savings of about \$100 million in RT and
 - ⇒ \$150 million in DA.
- ⇒ 2015 Hedman et al corrective switching eliminates post-contingency violations
 - ⇒ In PJM, eliminates post-contingency violations ~70%
 - ⇒ Estimated savings: \$100M/year

joint optimization

- ⇒ 2005 PJM and MISO commit to joint optimization
- ⇒ 2006 PJM and MISO decommit to joint optimization
- ⇒ 2015 still working on it
- ⇒ About half the transactions crossing borders go against the price differences
- ⇒ To set benchmarks for evaluating approximation

distribution optimization

- ⇒ Decentralized markets
- ⇒ Distribution systems generally are trees and simple cycle networks
- ⇒ Smart grids and markets
- ⇒ Losses can be high, e.g., 30%
 - ⇒ Reconfiguration switching
 - ⇒ Locating new assets
- ⇒ Lowering losses lowers prices on the entire line

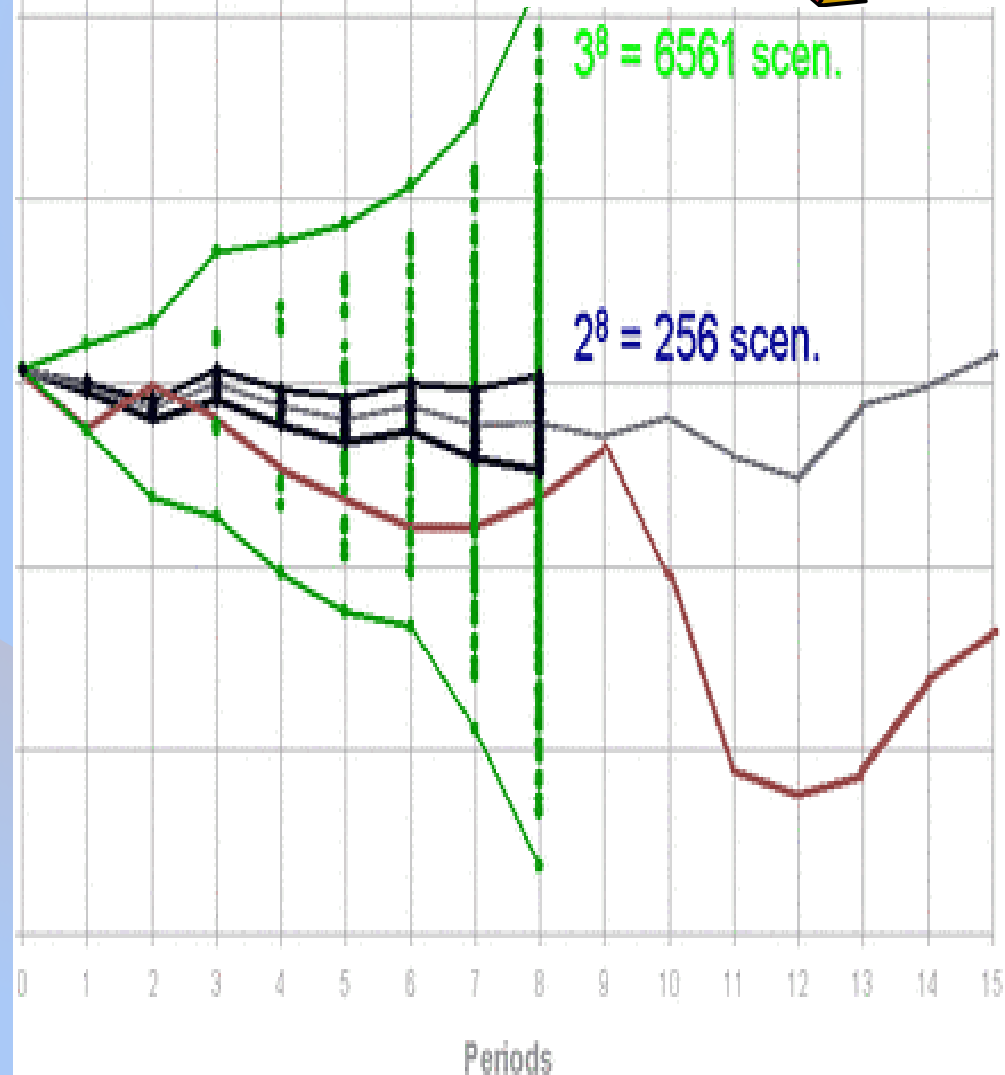

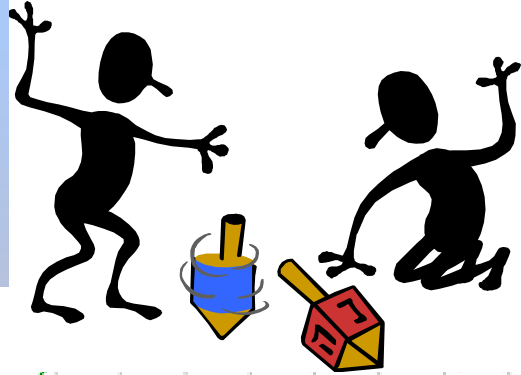

stochastic issues

⇒ Old

- ⇒ Forced outage model of generation
- ⇒ Estimating tomorrow's demand with temperature forecast
- ⇒ Estimating long term demand with GPD forecast

⇒ New

- ⇒ Ramp rate model of generation
- ⇒ Weather forecasts
- ⇒ temperature
- ⇒ wind
- ⇒ cloud cover

2020

software

better
software
and
hardware

- ⇒ Price-responsive demand
